

Executive Overview

Applying the Continuous Commissioning® (CC® 1) process typically reduces energy cost by about 20% in existing buildings as measured by the methods outlined in the USDOE's International Performance Measurement and Verification Protocol. The CC® techniques developed at the Energy Systems Laboratory involve monitoring and solid engineering analysis of mechanical systems and occupant needs. Increased skills and training are needed to obtain energy savings in buildings today. CC® addresses this need. This branded process can be implemented only by qualified, licensed providers.
